

Non-stick- and lubrication-coating for faster production processes

Gutbrod non-stick- and lubrication-coating for faster production processes, extension of cleaning intervals and improvement of the quality of products in the industry.

One of the prominent features of fluoropolymer coatings is the fact that the surface cannot be wetted by most substances and therefore has an excellent antiadhesive and enormously favourable sliding behavior.

This factor remedies the food industry, virtually in almost all industrial sectors, including general engineering.

Cost-intensive machine downtimes due to long and intensive cleanings can be avoided and production processes can be accelerated and extended.

Our non-stick coatings (PTFE, FEP, PFA, Sol-Gel) meet many different requirements, they are FDA approved and EU compliant.

Due to the ever-increasing demands on surface systems, we have developed from a purely contract coater to a material refiner.

Research and development therefore play a key role at Rudolf Gutbrod GmbH. Close communication and workshops with our customers help us adapt our surfaces to all customer requirements.

Contact us, describe your challenge and together we will find the right surface with the best performance for you.

We create your Solution!
